$$\frac{x}{(-4)(-5)-(3)(-10)} = \frac{y}{(-10)(4)-(-5)(3)} = \frac{1}{(3)(3)-(4)(-4)}$$

$$\frac{x}{(20)-(-30)} = \frac{y}{(-40)-(-15)} = \frac{1}{(9)-(-16)}$$

$$\frac{x}{20+30} = \frac{y}{-40+15} = \frac{1}{9+16}$$

$$\frac{x}{50} = \frac{y}{-25} = \frac{1}{25}$$

Therefore, we get $x = \frac{50}{25}; \quad y = \frac{-25}{25}$

$x = 2; \quad y = -1$

Thus the solution is $x = 2$, $y = -1$.

Verification :

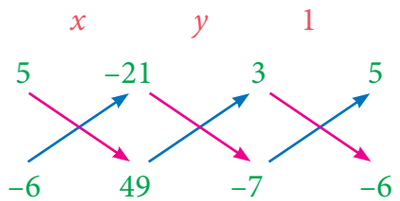

$3x-4y$	=	10	...(1)
$3(2)-4(-1)$	=	10	
$6+4$	=	10	
10	=	10	True
$4x+3y$	=	5	...(2)
$4(2)+3(-1)$	=	5	
$8-3$	=	5	
5	=	5	True

Example 3.53 Solve by cross multiplication method : $3x+5y=21;\ -7x-6y=-49$

Solution

The given system of equations are $3x+5y-21=0;\ -7x-6y+49=0$

Now using the coefficients for cross multiplication, we get,

$$\Rightarrow \frac{x}{(5)(49)-(-6)(-21)} = \frac{y}{(-21)(-7)-(49)(3)} = \frac{1}{(3)(-6)-(-7)(5)}$$

$$\frac{x}{119} = \frac{y}{0} = \frac{1}{17}$$

$$\Rightarrow \quad \frac{x}{119} = \frac{1}{17}, \quad \frac{y}{0} = \frac{1}{17}$$

$$\Rightarrow \quad x = \frac{119}{17}, \quad y = \frac{0}{17}$$

$$\Rightarrow \quad x = 7, \quad y = 0$$

Verification :

$3x+5y$	=	21	...(1)
$3(7)+5(0)$	=	21	
$21+0$	=	21	
21	=	21	True
$-7x-6y$	=	−49	...(2)
$-7(7)-6(0)$	=	−49	
-49	=	−49	
-49	=	−49	True

Note

Here $\frac{y}{0} = \frac{1}{17}$ is to mean $y = \frac{0}{17}$. Thus, $\frac{y}{0}$ is only a notation and it is not division by zero. It is always true that division by zero is not defined.
